The agent's core *conceptually*

- Text input
- Video / Audio
- Alarm signal
- etc.

Observation

Action

- Text output
- Audio / Video
- Robot move
- Garage door manipulation
- etc.

ReAct agent

System prompt

User input

LLM output

Solve a question answering task with interleaving Thought, Action, Observation steps.

Thought can reason about the current situation, and Action can be three types:

(1) Search[entity], which searches the exact entity on Wikipedia and returns the first paragraph if it exists. If not, it will return some similar entities to search.

(2) Lookup[keyword], which returns the next sentence containing keyword in the current passage.

(3) Finish[answer], which returns the answer and finishes the task.

Here are some examples.

Many examples look like the further conversation

Question:

Who is the president of the US?

Thought 1: I need to search current president of the US.

Action 1: Search[president of the US]

Observation: The president of the US is Joe Biden.

Thought 2: The president is Joe Biden.

Action 2: Finish[Joe Biden]

That's it 😊
